Aim 1

In adolescents, attachment insecurity has been identified as a correlate of suicide (Adam, Sheldon-Keller, & West, 1996) and psychopathology (Deklyen & Greenberg, 2008), making it an essential area for research and assessment. However, there is generally a lack of measures that acknowledge developmental differences in attachment between adolescents and adults (see Kobak et al., 2006). The Child Attachment Interview (CAI; Target et al., 2007) was developed to acknowledge this limitation in existing measures (Shmueli-Goetz, Target, Fonagy, & Datta, 2008) but has not been validated in adolescents nor among inpatients. Therefore, the first aim of the current study was to validate the CAI among inpatient adolescents.

Aim 2

The measurement of attachment has been complicated by disagreement regarding whether the construct is categorical or dimensional in nature. The developers of the CAI resolved this issue by using both dimensional subscales and overall categorical classifications in their coding scheme. However, the factor structure of the CAI has not been explored in order to determine whether using these subscales is appropriate. Therefore, our second aim was to do so and compare the validity of the CAI when used both categorically and dimensionally.

Sample

194 adolescents (M_{age} = 16, 59.3% female) were recruited from the inpatient unit of a private hospital. On the basis of the CAI (used categorically), 30.4% of the sample was classified as secure and 69.5% as insecure.

Attachment in Adolescence: Dimensional and Categorical Use of the Child Attachment Interview Amanda Venta, M.A. & Carla Sharp, Ph.D. University of Houston

Measures

Concurrent: Security Scale, Inventory of Parent & Peer Attachment, Parental Bonding Instrument. Convergent: Inventory of Parent and Peer Attachment, Youth Self Report, Child Behavior Checklist.

Results: Concurrent Validity

Conclusions

Factor analysis identified three factors in the CAI: coherence, anger, and idealizing, used to create 3 subscales for dimensional analyses. Analyses revealed adequate interrater reliability and concurrent and convergent validity for the CAI when used both dimensionally and categorically.
